Use Case Document

1. Introduction

1.1 Purpose

The purpose of the *Use Case Document* is to define the use cases for the Boolean Expression Evaluator. It describes the defined use cases and provides a UML Use Case diagram as a visual aid.

The following people use the *Use Case Document*:

- The **configuration manager** uses it to define the design of the BEX.

1.2 Scope

This *Use Case Document* describes the basic functionality to be designed into the Boolean Expression Evaluator project.

1.3 Definitions, Acronyms, and Abbreviations

See the Project Glossary.

1.4 References

For the **Use Case Document**, the list of referenced artifacts includes:

- Software Requirements Specifications

1.5 Overview

This *Use Case Document* contains the following information:

Use Cases	—	provides a description of the project's use cases.
Use Case Diagram	—	provides a visual description of the project's use cases.

2. Use Cases

2.1 Use Case 1

As a **user** I want to **enter a Boolean expression** so that **the solution to the expression is presented**.

Outline:

1. Select "Evaluate Expression."
2. Enter Boolean expression.
3. Receive the solution to the expression as output.

Basic Flow:

1. The user enters a Boolean expression.
 - a. The use case starts when the user enters a Boolean expression using predefined characters.
2. The user receives the solution to the Boolean expression.
 - a. The system evaluates the expression and outputs the solution on the screen.

Alternative Flows:

- A1 Error in expression syntax.
 - a. If the user makes an error in the syntax of the Boolean expression, the system will present an error message explaining the syntactic snafu.

2.2 Use Case 2

As a **user** I want to **set a Boolean-valued variable** so that **the variable can be used in expressions**.

Outline:

1. Select "Add Variable."
2. Choose character to represent the variable.
3. Set Boolean value of the variable.

Basic Flow

1. The user selects "Add Variable" from the main screen.
 - a. The use case starts when the user selects "Add Variable."
2. The user chooses a character to represent the variable.
 - a. The user can enter any character from their keyboard that is not already taken by the system.
3. The user sets the Boolean value of the variable.
 - a. The user can enter T for true or F for false to set the value of the variable.

Alternative Flow

- A1 User changes current variable.
 - a. The user can choose an already defined variable and change its Boolean value. If the user enters 0, the variable will be deleted.
